EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Harry Shubin on 9/24/2009.

The application has been amended as follows:

In claim 6 replace the last three words "used in c)." with:

"used in g)."

Cancel claims 7 and 8.

2. The following is an examiner's statement of reasons for allowance:
3. The prior art does not anticipate or make obvious a process for creating a monolithic porous molding from a sol gel material where it completely fills the mold by activation of the mold wall, where the mold has an internal diameter between 0.5 to 50 mm.
4. The closest prior art is Lubda (U.S. PGPub 2003/0155676: already of record). Lubda teaches the creation of monolithic porous moldings in a mold having an internal diameter of 1 to 100 mm. Lubda does not teach the activation of the mold wall, also the

process of Lubda requires that the molding shrinks away from the mold wall and the gap refilled with sol gel material until the internal diameter is filled.

5. No where in the prior does the use of mold wall activation hint at success when scaled up to 0.5 to 50 mm due to the scaling up of the shrinkage that would occur. As shown by Oberacher et al (Preparation and evaluation of packed capillary columns for the separation of nucleic acids by ion-pair reversed-phase high-performance liquid chromatography: already of record) and Ishizuka et al (Preparation and Chromatographic Application of Macroporous Silicate in a Capillary: already of record), both of whom were published in 2000, used molds that had internal diameters of 200 and 100 microns respectively, and both activated the mold wall. However no one in the prior art since the year 2000 has presented any further evidence that activation of the mold walls could help produce monolithic porous moldings that completely fill their molds when the internal diameter of the mold is increased to 0.5 to 50 mm. For example in 2002 Tanaka et al (Monolithic silica columns for high-efficiency chromatographic separations: already of record) teaches using molds with internal diameters of 6-9 mm. Tanaka et al does not activate the mold wall and allows for shrinkage to occurs, thus not producing moldings that completely fill their molds. Therefore claims 1-6 have been allowed over the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
